

## Process and Challenges

I had some initial issues with the project not working correctly from the start, but I think that was an installation issue because it worked after a fresh installation of Code Composer Studio (CCS) and the SimpleLink SDK. After installation of CCS and the SimpleLink SDK, I mostly followed the Milestone One Lab Guide, but had to branch off from it when things didn't quite match up right. I imported the project from the "Browse and Import Examples" section from the "Getting Started" page. It took a few attempts before finding the \*correct\* one because there are several compiler and kernel options.

I don't have any questions or any other difficulties. I believe everything is working correctly now. Although I don't have an example of what is supposed to be happening with the LEDs, so I don't know how my project compares, I suppose I'll find out after I submit the Milestone next week.
